

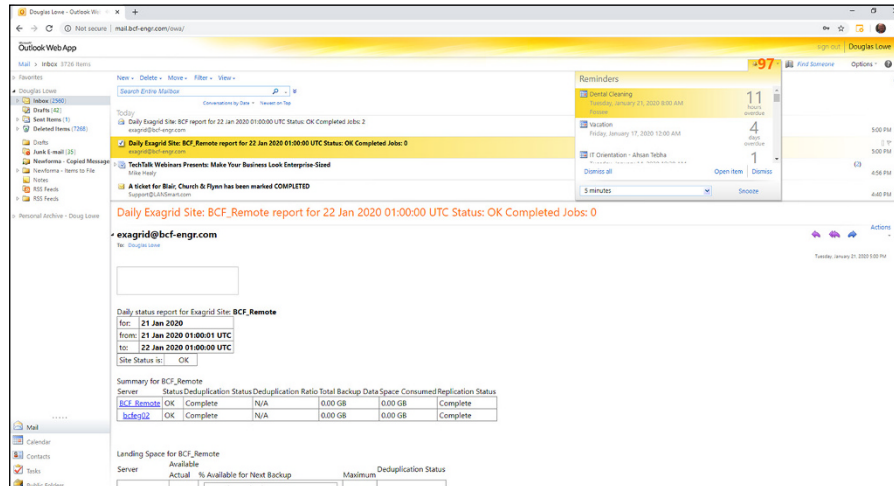

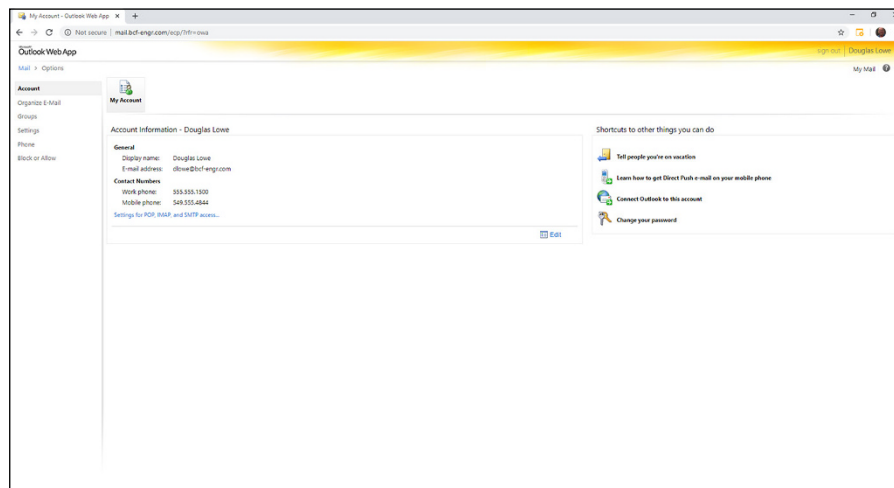

**FIGURE 24-1:**  
OWA looks a lot  
like Outlook.

**FIGURE 24-2:**  
Set OWA options  
here.

## Using a Virtual Private Network

A *virtual private network* (VPN) is a type of network connection that creates the illusion that you're directly connected to a network when in fact, you're not. For example, suppose you set up a LAN at your office, but you also occasionally work from home. But how will you access the files on your work computer from home?

- » You could simply copy whatever files you need from your work computer onto a flash drive and take them home with you, work on the files, copy the updated files back to the flash drive, and take them back to work with you the next day.
